Max. Time: $3\frac{1}{2}$ hrs.

Max. Marks: 200

**GENERAL KNOWLEDGE**

1. Euthanasia (mercy killing) was first legalized in:
   (1) Switzerland  (2) Netherlands  (3) France  (4) Italy

2. Positron emission tomography (PET) is one of the best methods for functional imaging because:
   (1) Isotopes of basic body elements are used for imaging
   (2) Isotopes with long half-lives are used
   (3) Isotopes with short half-lives are used
   (4) Positrons are directly involved in imaging

3. Magnetic Resonance (MR) images are derived from the proton-bearing species present principally from water and:
   (1) Long alkane chain protons of the fatty acid moieties
   (2) Short alkane chain protons of the fatty acid moieties
   (3) Long alkene chain protons of the fatty acid moieties
   (4) Short alkene chain protons of the fatty acid moieties

4. The following separation technique depends on the molecular size of the protein:
   (1) Chromatography on a carboxymethyl (CM) cellulose column
   (2) Iso-electric focusing
   (3) Gel filtration chromatography
   (4) Chromatography on a diethylaminoethyl (DEAE) cellulose column

5. The approximate number of genes contained in the genome of Kalpana Chawla was:
   (1) 40,000  (2) 30,000  (3) 80,000  (4) 1,00,000

6. In the internet what does 'http' mean?
   (1) High Transfer Text Protocol
   (2) Highest Transfer Text Protocol
   (3) Hyper Text Transfer Protocol
   (4) Hyper Transfer Text Protocol

7. The India-born US physicist who was awarded the Nobel prize in Physics for his work on astrophysics is:
   (1) H.G. Khorana
   (2) Subrahmanyan Chandrasekhar
   (3) Sivaramakrishna Chandrasekhar
   (4) C.V. Raman

8. Which German physicist invented the electron microscope which won him the 1986 Nobel Prize in Physics?
   (1) Ernst Ruska  (2) Van't Hoff  (3) J.H.D. Jensen  (4) Eugene P Wigner

9. Who was the first Indian to be awarded the World Food Prize in 1987?
   (1) M.S. Swaminathan
   (2) Sunderlal Bahuguna
   (3) Anna Hazare
   (4) B.R. Barwale

10. Thanatology is the science that deals with:
    (1) Dealt in all its aspects
    (2) Solving paternity of child
    (3) Identification of living
    (4) Detection of lie

11. What is the disease, Tetanus also known as?
    (1) Gangrene  (2) Shingles  (3) Lockjaw  (4) Whooping Cough
12. When seen from earth, which of the following planet eclipsed (crossed a cross) of the sun on May 7, 2003?
(1) Mercury  (2) Uranus
(3) Saturn   (4) Jupiter

13. Israel’s Prime Minister Yitzhak Rabin won the Noble Prize for
(1) Peace       (2) Literature
(3) Chemistry   (4) Economics

14. Who was the world’s first space tourist?
(1) Desmond Rickett
(2) Dennis Tito   (3) Igor Kajelnikov
(4) Li Wang

15. Which city was gifted to Charles II by the Portuguese when the married the sister of the King of Portugal in 1662?
(1) Mumbai     (2) Paris
(3) Lisbon     (4) Castile

16. How many “World Cultural Heritage Sites” are there in India?
(1) 10         (2) 17      (3) 14
(4) 15

17. Who is the mother of Bharat in the epic Ramayana?
(1) Kaushalya   (2) Sumitra
(3) Urmila     (4) Kaikayee

18. Which of the ‘Nawab of Bengal’ is supposed to be responsible for ‘Black Hole’ of Calcutta (Kolkata)?
(1) Mir Jafer    (2) Sirjuddaula
(3) Alivardi Khan (4) Sarfaraj Khan

19. In which country the ‘DOGS’ were once worshiped as ‘GODS’?
(1) Egypt       (2) Greece
(3) Italy      (4) Mangolia

20. From which of the following places the international dateline crosses:
(1) Atlantic ocean    (2) Pacific ocean
(3) Greenwich         (4) Cape of Good Hope

BIOLOGY

21. The crystal of lead zirconate is a key component of:
(1) Electroencephalography
(2) Electrocardiography
(3) Magnetoencephalography
(4) Sonography

22. Which one of the following is a matching pair of a certain body feature and its value count in a normal human adult?
(1) Urea – 5–10 mg /100 ml of blood
(2) Blood sugar (fasting) – 70–100 mg/100 ml
(3) Total blood volume – 3–4 litres
(4) ESR in Wintrobe method – 9–15 mm in males and 20–34 mm in females

23. Which one of the following pairs of term/ names mean one and the same thing?
(1) Gene pool – genome
(2) Codon – gene       (3) Cistron – triplet
(4) DNA fingerprinting – DNA profiling

24. Which one of the following is a matching pair?
(1) Lubb–Sharp closure of AV valves at the beginning of ventricular systole
(2) Dup–Sudden opening of semilunar valves at the beginning of ventricular diastole
(3) Pulsation of the radial artery–Valves in the blood vessels
(4) Initiation of the heart beat – Purkinje fibres

25. Mr. X is eating curd/yoghurt. For this food intake in a food chain he should be considered as occupying:
(1) First trophic level
(2) Second trophic level
(3) Third trophic level
(4) Fourth trophic level

26. July 11 is observed as:
(1) World Population Day
(2) No Tobacco Day
(3) World Environment Day
(4) World Health Day

27. Biological Oxygen Demand (BOD) is a measure of:
(1) Industrial wastes poured into water bodies
(2) Extent to which water is polluted with organic compounds
(3) Amount of carbon monoxide inseparably combined with haemoglobin
(4) Amount of oxygen needed by green plants during night

28. Which one of the following is a sesamoid bone?
(1) Pelvis (2) Patella (3) Pterygoid (4) Pectoral girdle

29. Both corpus luteum and macula lutea are:
(1) Found in human ovaries (2) A source of hormones (3) Characterized by a yellow colour (4) Contributory in maintaining pregnancy

30. Photorespiration in C₃ plants starts from:
(1) Phosphoglycerate (2) Phosphoglycolate (3) Glycerate (4) Glycine

31. Just as Xenopsylla is to Yersenia pestis so is:
(1) Glossian palpalis to Wuchereria bancrofti (2) Culex to Plasmodium falciparum (3) Homo sapiens to Taenia solium (4) Phlebotomus to Leishmania donovani

32. Continued consumption of a diet rich in butter, red meat and eggs for a long period may lead to:
(1) Vitamin A toxicity (2) Kidney stones (3) Hypercholesterolemia (4) Urine laden with ketone bodies

33. Drinking of mineral water with very low levels of pesticides (about 0.02 ppm) for long periods may:
(1) Produce immunity against mosquito (2) Cause leukemia (blood cancer) in most people (3) Cause cancer of the intestine (4) Lead to accumulation of pesticide residues in body fat

34. A person passes much urine and drinks much water but blood glucose level is normal. This condition may be the result of:
(1) A reduction in insulin secretion from pancreas (2) A reduction in vasopression secretion from posterior pituitary (3) A fall in the glucose concentration in urine (4) An increase in secretion of glucagon

35. What is true about tRNA?
(1) It binds with an amino acid at 3 end (2) It has five double stranded regions (3) It has a codon at one end which recognizes the anticodon on messenger RNA (4) It looks like clover leaf in the three dimensional structure

36. An example of competitive inhibitions of an enzyme is the inhibition of:
(1) Succinic dehydrogenase by malonic acid (2) Cytochrome oxidase by cyanide (3) Hexokinase by glucose -6 phosphate (4) Carbonic anhydrase by carbon dioxide

37. Which one of the following is a matching pair of certain organism(s) and the kind of association?
(1) Shark and sucker fish -commensalism (2) Algae and fungi in lichens -mutualism (3) Orchids growing on trees -parasitism (4) Cuscuta (dodder) growing on other flowering plants -epiphytism

38. Photochemical smog formed in congested metropolitan cities mainly consists of:
(1) Ozone peroxacyetyl nitrate and NOₓ (2) Smoke, peroxacyetyl nitrate and SO₂ (3) Hydrocarbons SO₂ and CO₂ (4) Hydrocarbons ozone and SOₓ

39. In almost all Indian metropolitan cities like Delhi, the major atmospheric pollutant(s) is/are:
(1) Suspended particulate matter(SPM) (2) Oxides of sulphur (3) Carbon dioxide and carbon monoxide (4) Oxides of nitrogen
40. Excessive stimulation of vagus nerve in humans may lead to:
(1) Hoarse voice
(2) Peptic ulcers
(3) Efficient digestion of proteins
(4) Irregular contractions of diaphragm

41. Restriction enzymes:
(1) Are endonucleases which cleave DNA at specific sites
(2) Make DNA complementary to an existing DNA or RNA
(3) Cut or join DNA fragments
(4) Are required in vectorless direct gene transfer

42. Which one of the following correctly represents the manner of replication of DNA?

43. Which one of the following codons codes for the same information as UGC?
(1) UGU  (2) UGA
(3) UAG  (4) UGG

44. The map given below indicates the former and the present distribution of an animal: Which animal could it be?
(1) Wild ass  (2) Nilgai
(3) Black buck  (4) Lion

45. A person is wearing spectacles with concave lens for correcting vision. While not using the glasses, the image of a distant object in his case will be formed
(1) On the blind spot
(2) Behind the retina
(3) In front of the retina
(4) On the yellow spot

46. The early stage human embryo distinctly possesses:
(1) Gills  (2) gill slits
(3) External ear (pinna)  (4) Eye brows

47. The phase of menstrual cycle in humans that lasts for 7-8 days, is:
(1) Follicular phase  (2) Ovulatory phase
(3) Luteal phase  (4) Menstruation

48. The source of somatostatin is same as that of:
(1) Thyroxine and calcitonin  (2) Insulin and glucagon
(3) Somatotropin and prolactin  (4) Vasopresin and oxytocin

49. People recovering from long illness are often advised to include the alga Spirulina in their diet because it.
(1) Makes the food easy to digest  (2) Is rich in proteins
(3) Has antibiotic properties  (4) Restores the intestinal microflora

50. Viroids have:
(1) Single stranded RNA not enclosed by protein coat
51. In a dicotyledonous stem, the sequence of tissues from the outside to the inside is:

(1) Phellem-Pericycle-Endodermis-Phloem
(2) Phellem-Pericycle-Endodermis-Phloem
(3) Phellem-Endodermis-Pericycle-Phloem
(4) Pericycle-Phellem-Endodermis-Phloem

52. Hill reaction occurs in:

(1) High altitude plants
(2) Total darkness
(3) Absence of water
(4) Presence of ferricyanide

53. Which one of the following pairs is correctly matched?

1. Rhizobium – Parasite in the roots of leguminous plants.
2. Mycorrhiza – Mineral uptake from soil
3. Yeast – Production of biogas
4. Myxomycetes – The disease ring worm

54. Pollen grains are able to withstand extremes of temperature and desiccation because their exine is composed of:

(1) Cutin
(2) Suberin
(3) Sporopollenin
(4) Callose

55. One of the genes present exclusively on the X-chromosome in humans is concerned with:

(1) Baldness
(2) Red-green colour blindness
(3) Facial hair, mustaches in males
(4) Night blindness

56. Which one of the following statements with regard to embryonic development in humans is correct?

(1) Cleavage divisions bring about considerable increase in the mass of protoplasm
(2) In the second cleavage division, one of the two blastomers usually divides a little sooner than the second

57. Plasmodesmata connections help in:

(1) Cytoplasmic streaming
(2) Synchronous mitotic divisions
(3) Locomotion of unicellular organisms
(4) Movement of substances between cells

58. The quiescent centre in root meristem serves as:

(1) Site for storage of food which is utilized during maturation
(2) Reservoir of growth hormones
(3) Reserve for replenishment of damaged cells of the meristem
(4) Region for absorption of water

59. Azolla is used as a biofertilizer because:

(1) Multiplies very fast to produce massive biomass
(2) Has association of nitrogen-fixing Rhizobium
(3) Has association of nitrogen-fixing Cyanobacteria
(4) Has association of mycorrhiza

60. The plant part which consists of two generations one within the other is:

(1) Germinated pollen grain
(2) Embryo
(3) Unfertilized ovule
(4) Seed

61. The paramagnetic species is:

(1) \( \text{K}^+ \)
(2) \( \text{Si}^+ \)
(3) \( \text{Ti}^+ \)
(4) \( \text{Ba}^+ \)

62. The reagent commonly used to determine hardness of water titrimetrically is:

(1) Oxalic acid
(2) Disodium slat of EDTA
(3) Sodium citrate
(4) Sodium thiosulphate

63. The true statement for the acids of phosphorus.
H₃PO₂, H₃PO₃ and H₃PO₄ is:
(1) The order of their acidity is
   \[\text{H}_3\text{PO}_4 > \text{H}_3\text{PO}_3 > \text{H}_3\text{PO}_2\]
(2) All of them are reducing in nature
(3) All of them are tribasic acids
(4) The geometry of phosphorus is tetrahedral in all the three

64. The ion which is not tetrahedral in shape is:
   (1) BF₄⁻   (2) NH₄⁺  
   (3) Cu(NH₃)₄²⁺  (4) NiCl₂⁻

65. The complex used as an anticancer agent is:
   (1) mer-[Co(NH₃)₃Cl₃]  
   (2) cis-[PtCl₂(NH₃)₂]  
   (3) cis-K₂[PtCl₂Br₂]  
   (4) Na₂CoCl₄

66. The colourless species is:
   (1) VCl₃  (2) VO₃SO₄
   (3) Na₃VO₄
   (4) [V(H₂O)₆]SO₄H₂O

67. MnO₄⁻ (1 mole) in neutral aqueous medium is disproportionate to:
   (1) 2/3 mole of MnO₄⁻ and 1/3 mole of MnO₂
   (2) 1/3 mole of MnO₄⁻ and 2/3 mole of MnO₂
   (3) 1/3 mole of Mn₂O₇ and 1/3 mole of MnO₂
   (4) 2/3 mole of Mn₂O₇ and 1/3 mole of MnO₂

68. Lanthanide for which +II and +III oxidation states are common is:
   (1) La  (2) Nd
   (3) Ce  (4) Eu

69. The mixture of concentrated HCl and HNO₃ made in 3:1 ratio contains:
   (1) ClO₂  (2) NOCl
   (3) NCl₃  (4) N₂O₄

70. On dissolving moderate amount of sodium metal in liquid NH₃ at low temperature. Which one of the following does not occur?
   (1) Blue coloured solution is obtained
   (2) Na⁺ ions are formed in the solution
   (3) Liquid NH₃ becomes good conductor of electricity
   (4) Liquid ammonia remains diamagnetic

71. The ligand called \(\pi\) acid is:
   (1) CO  (2) NH₃
   (3) C₂O₄²⁻  (4) Ethylene diamine

72. The compound used for gravimetric estimation of copper (II) is:
   (1) Cu₂(SCN)₂  (2) Cu₂O
   (3) Cu₂I₂  (4) Cu₂CO₃

73. In the extraction of the copper from its sulphide ore the metal is formed by reduction of Cu₂O with:
   (1) FeS  (2) CO
   (3) Cu₂S  (4) SO₂

74. Among the following the strongest acid is:
   (1) CH₃COOH  (2) C₆H₅COOH
   (3) m-CH₃OC₆H₄COOH  (4) p-CH₃OC₆H₄COOH

75. Among the following the weakest base is:
   (1) C₆H₅CH₂NH₂  (2) C₆H₅CH₂NHCH₃
   (3) O₂NCH₂NH₂  (4) CH₃NHCHO

76. IUPAC name of
   \[ \text{CH₃} \]
   (1) 3-methyl cyclohexene
   (2) 1-methyl cyclohexene
   (3) 3-methyl cyclohexene
   (4) 1-methyl cyclohexene

77. Intermolecular hydrogen bonding is strongest in:
   (1) Methylamine  (2) Phenol
78. The ortho/para directing group among the following is:
   (1) COOH  (2) CN  (3) COCH₃  (4) NHCOCH₃

79. The treatment of benzene with isobutene in the presence of sulphuric acid gives:
   (1) Isobutyl benzene  (2) Tert-butyl benzene  (3) n-Butyl benzene  (4) No reaction

80. The most reactive nucleophile among the following is:
   (1) CH₃O⁻  (2) C₆H₅O⁻  (3) (CH₃)₂CHO⁻  (4) (CH₃)₃CO⁻

81. The absolute configuration of the following compound is:
   \[ \text{CH}_3 \quad \text{H} \quad \text{Cl} \quad \text{Cl} \quad \text{C}_2\text{H}_5 \]
   (1) 2 S, 3 R  (2) 2 S, 3 S  (3) 2 R, 3 S  (4) 2 R, 3 R

82. Subunits present in haemoglobin are:
   (1) 2  (2) 3  (3) 4  (4) 5

83. At higher temperature, iodoform reaction is given by:
   (1) CH₃CO₂CH₃  (2) CH₃CO₂C₂H₅  (3) C₆H₅CO₂CH₃  (4) CH₃CO₂C₆H₅

84. Among the following the achiral amino acid is:
   (1) 2-Ethylalanine  (2) 2-Methylglycine  (3) 2-Hydroxymethyl serine  (4) Tryptophan

85. Nitrobenzene gives N-phenylhydroxylamine by:
   (1) Sn/HCl  (2) H₂/Pd - C  (3) Zn/NaOH  (4) Zn/NH₄Cl

86. Propan-1-ol can be prepared from propene by:
   (1) H₂O/H₂SO₄  (2) Hg(Ⅱ)OAc₂/H₂O followed by NaBH₄  (3) B₂H₆ followed by H₂O₂  (4) CH₃CO₂H/H₂SO₄

87. Which of the following are arranged in the decreasing order of dipole moment?
   (1) CH₃Cl, CH₃Br, CH₃F  (2) CH₃Cl, CH₃F, CH₃Br  (3) CH₃Br, CH₃Cl, CH₃F  (4) CH₃Br, CH₃F, CH₃Cl

88. What is the coordination number of sodium in Na₂O?
   (1) 6  (2) 4  (3) 8  (4) 2

89. Which of the following compounds possesses the C-H bond with the lowest bond dissociation energy?
   (1) Toluene  (2) Benzene  (3) n-Pentane  (4) 2,2-Dimethyl propane

90. One gram sample of NH₄NO₃ is decomposed in a bomb calorimeter. The temperature of the calorimeter increases by 6.12 K. The heat capacity of the system is 1.23 kJ/g/deg. What is the molar heat of decomposition for NH₄NO₃?
   (1) -7.53 kJ/mol  (2) -39.81 kJ/mol  (3) -16.1 kJ/mol  (4) -602 kJ/mol

91. Which one of the statements given below concerning properties of solutions describes a colligative effect?
   (1) Boiling point of pure water decreases by the addition of ethanol
   (2) Vapour pressure of pure water decreases by the addition of nitric acid
   (3) Vapour pressure of pure benzene decreases by the additions of naphthalene
   (4) Boiling point of pure benzene increases by the addition of toluene

92. Which of the following reactions is used to make a fuel cell?
(1) Cd (s) + 2 Ni (OH)₃ (s) → CdO(s) + 2 Ni (OH)₂ (s) + H₂ O (l)
(2) Pb (s) + PbO₂ (s) + 2H₂ SO₄ (aq) → 2 PbSO₄ (s) + 2H₂ O (l)
(3) 2H₂ (g) + O₂ (g) → 2 H₂ O (l)
(4) 2Fe (s) + O₂ (g) + 4H⁺ (aq) → 2 Fe²⁺ (aq) + 2H₂ O (l)

93. Which one of the following is NOT a buffer solution?
(1) 0.8M H₂S + 0.8M KHS
(2) 2M C₆ H₅ NH₂ + 2M C₆ H₅ NH₃ Br
(3) 3 M H₂ CO₃ + 3 M KHCO₃
(4) 0.05M KClO₄ + 0.05 M HClO₄

94. Which one of the following has ΔS° greater than zero?
(1) CaO (s) + CO₂ (g) ↔ CaCO₃ (s)
(2) NaCl (aq) ↔ NaCl(s)
(3) NaNO₃ (s) ↔ Na⁺ (aq) + NO₃⁻ (aq)
(4) N₂ (g) + 3H₂ (g) ↔ 2NH₃ (g)

95. The quantum number 'm' of a free gaseous atom is associated with:
(1) The effective volume of the orbital
(2) The shape of the orbital
(3) The spatial orientation of the orbital
(4) The energy of the orbital in the absence of a magnetic field

96. Which one of the following is not a surfactant?

\[
\begin{align*}
&\text{CH₃} \\
(1) &\text{CH₃ - (CH₂)₁₅ - N⁺ - CH₃ Br⁻} \\
(2) &\text{CH₃ - (CH₂)₁₄ - CH₂ - NH₂} \\
(3) &\text{CH₃ - (CH₂)₁₆ - CH₂ OSO₂⁻ Na⁺} \\
(4) &\text{OHC - (CH₂)₁₄ - CH₂ - COO⁻ Na⁺}
\end{align*}
\]

97. Time required to deposit one millimole of aluminum metal by the passage of

9.65 amperes through aqueous solution of aluminum ion is:
(1) 30 s
(2) 10 s
(3) 30,000 s
(4) 10,000 s

98. In which of the following acid –base titration, pH is greater than 8 at equivalence point:
(1) Acetic acid versus ammonia
(2) Acetic acid versus sodium hydroxide
(3) Hydrochloric acid versus ammonia
(4) Hydrochloric acid versus sodium hydroxide

99. Which of the following is not a greenhouse gas?
(1) Carbon dioxide
(2) Water vapour
(3) Methane
(4) Oxygen

100. The potential energy diagram for a reaction R → P is given below

\[\Delta H°\] of the reaction corresponds to the energy
(1) a
(2) b
(3) c
(4) a + b

PHYSICS

101. The velocity with which a projectile must be fired so that it escapes earth’s gravitation does not depend on:
(1) Mass of the earth
(2) Mass of the projectile
(3) Radius of the projectile’s orbit
(4) Gravitational constant

102. Bernoulli’s equation is a consequence of conservation of:
(1) Energy
(2) Linear momentum
103. A laser beam is used for carrying out surgery because it:
(1) Is highly monochromatic
(2) Is highly coherent
(3) Is highly directional
(4) Can be sharply focused

104. A wire of length L is drawn such that its diameter is reduced to half of its original diameter. If the initial resistance of the wire 10Ω, its new resistance would be:
(1) 40 Ω (2) 80 Ω (3) 120 Ω (4) 160 Ω

105. A proton is about 1840 times heavier than an electron. When it is accelerated by potential difference of 1 kV, its kinetic energy will be:
(1) 1840 keV (2) 1.840 keV (3) 1 keV (4) 920 keV

106. An electric dipole placed in a non-uniform electric field experiences:
(1) Both a torque and a net force
(2) Only a force but no torque
(3) Only a torque but no net force
(4) No torque and no net force

107. In an ideal parallel LC circuit, the capacitor is charged by connecting it to a dc source which is then disconnected. The current in the circuit:
(1) Becomes zero instantaneously
(2) Grows monotonically
(3) Decays monotonically
(4) Oscillates instantaneously

108. To a germanium sample, traces of gallium are added as an impurity. The resultant sample would behave like:
(1) A conductor
(2) A p-type semiconductor
(3) An n-type semiconductor
(4) An insulator

109. A radioactive substance decays to 1/16th of its initial activity in 40 days.

110. A neutron makes a head on elastic collision with a stationary deuteron. The fractional energy loss of the neutron in the collision is:
(1) 16/81 (2) 8/9 (3) 8/27 (4) 2/3

111. The motion of planets in the solar system is an example of the conservation of:
(1) Mass (2) Linear momentum (3) Angular momentum (4) Energy

112. Two small drops of mercury each of radius R. coalesce to form a single large drop. The ratio of the total surface energies before and after the change is:
(1) 1 : 2^{1/3} (2) 2^{1/3} : 1 (3) 2 : 1 (4) 1 : 2

113. A black body, at a temperature of 227°C, radiates heat at a rate of 20 cal m^-2 s^-1. When its temperature is raised to 727°C, the heat radiated by it in cal m^-2 s^-1 will be closest to:
(1) 40 (2) 160 (3) 320 (4) 640

114. Two springs of force constants k and 2k are connected to a mass as shown below:

The frequency of oscillation of the mass is:
(1) (1/2π) √(k/m) (2) (1/2π) √(2k/m) (3) (1/2π) √(3k/m) (4) (1/2π) √(m/k)

115. When a beam of light is used to determine the position of an object, the maximum accuracy is achieved if the light is:
116. A double slit experiment is performed with light of wavelength 500 nm. A thin film of thickness 2 μm an refractive index 1.5 is introduced in the path of the upper beam. The location of the central maximum will:
(1) Remain unshifted
(2) Shift downward by nearly two fringes
(3) Shift upwards by nearly two fringes
(4) Shift downward by 10 fringes

117. If an electron and a photon propagate in the form of waves having the same wavelength, it implies that they have the same:
(1) Energy
(2) Momentum
(3) Velocity
(4) Angular momentum

118. Characteristic X-rays are produced due to:
(1) Transfer of momentum in collision of electrons with target atoms
(2) Transition of electrons from higher to lower electronic orbits in an atom
(3) Heating of the target
(4) Transfer of energy in collision of electrons with atoms in the target

119. Three charges are placed at the vertices of an equilateral triangle of side ‘a’ as shown in the following figure. The force experienced by the charge placed at the vertex A in the direction normal to BC is:

![Diagram](image)

120. A capacitor of capacitance 2 μF is connected in the tank circuit of an oscillator oscillating with a frequency of 1 kHz. If the current flowing in the circuit is 2 mA, the voltage across the capacitor will be:
(1) 0.16V
(2) 0.32V
(3) 79.5V
(4) 159V

121. The earth’s magnetic field at a given point is 0.5 × 10⁻⁵ Wb m⁻³. This field is to be annulled by magnetic induction at the centre of a circular conducting loop of radius 5.0 cm. The current required to be flown in the loop is nearly:
(1) 0.2 A
(2) 0.4 A
(3) 4 A
(4) 40 A

122. A frog can be levitated in a magnetic field produced by a current in a vertical solenoid placed below the frog. This is possible because the body of the frog behaves as:
(1) Paramagnetic
(2) Diamagnetic
(3) Ferromagnetic
(4) Antiferromagnetic

123. Shown below are the black body radiation curves at temperatures T₁ and T₂ (T₂ > T₁). Which of the following plots is correct?

![Plots](image)
124. Shown below is a distribution of charges. The flux of electric field due to the these charges through the surface S is:

\[ S \]

(1) \(3q/e_0\) \hspace{1cm} (2) \(2q/e_0\) \hspace{1cm} (3) \(q/e_0\) \hspace{1cm} (4) zero

125. In an experiment to find the focal length of a concave mirror a graph is drawn between the magnitudes of u and v. The graph looks like:

1. \(\uparrow\) \hspace{1cm} 2. \(\uparrow\) \hspace{1cm} 3. \(\downarrow\) \hspace{1cm} 4. \(\downarrow\)

\[ u \rightarrow \hspace{1cm} v \rightarrow \]

126. Nuclear fusion is possible:

(1) Only between light nuclei
(2) Only between heavy nuclei
(3) Between both light and heavy nuclei
(4) Only between nuclei which are stable against \(\beta\)-decay

127. An electron is travelling along the x-direction. It encounters a magnetic field in the y-direction. Its subsequent motion will be:

(1) Straight line along the x-direction
(2) A circle in the xz-plane
(3) A circle in the yz-plane
(4) A circle in the xy-plane

128. The difference in the lengths of a mean solar day and a sidereal day is about:

(1) 1 min \hspace{1cm} (2) 4 min \hspace{1cm} (3) 15 min \hspace{1cm} (4) 56 min

129. A body starting from rest moves along a straight line with a constant acceleration. The variation of speed (v) with distance (s) represented by the graph:

1. \[ s \rightarrow \] \hspace{1cm} 2. \[ s \rightarrow \] \hspace{1cm} 3. \[ s \rightarrow \] \hspace{1cm} 4. \[ s \rightarrow \]

130. A rectangular loop carrying a current \(i_1\) is situated near a long straight wire carrying a steady current \(i_2\). The wire is parallel one one of the sides of the loop and is in the plane of the loop as shown in the figure. Then the current loop will:

(1) Move away from the wire \hspace{1cm} (2) Move towards the wire \hspace{1cm} (3) Remain stationary \hspace{1cm} (4) Rotate about an axis parallel to the wire

131. A ball is thrown vertically upwards. Which of the following plots represents the speed–time graph of the ball during its flight if the air resistance is not ignored?
132. Radioactive nuclei that are injected into a patient collect at certain sites within its body, undergoing radioactive decay and emitting electromagnetic radiation. These radiations can then be recorded by detector. This procedure provides an important diagnostic tool called:

(1) Gamma camera
(2) CAT scan
(3) Radiotracer technique
(4) Gamma ray spectroscopy

133. In a material medium, when a positron meets an electron both the particles annihilate leading to the emission of two gamma ray photons. This process forms the basis of an important diagnostic procedure called:

(1) MRI (2) PET
(3) CAT (4) SPECT

134. An astronaut is looking down on earth’s surface from a space shuttle at an altitude of 400 km. Assuming that the astronaut’s pupil diameter is 5 mm and the wavelength of visible light is 500 nm, the astronaut will be able to resolve linear objects of the size of about:

(1) 0.5 m (2) 5 m
(3) 50 m (4) 500 m

135. An earthquake generates both transverse (S) and longitudinal (P) sound waves in the earth. The speed of S waves is about 4.5 km/s and that of P waves is about 8.0 km/s.

136. A seismograph records P and S waves from an earthquake. The first P wave arrives 4.0 min before the first S wave. The epicenter of the earthquake is located at a distance of about

(1) 25 km (2) 250 km
(3) 2500 km (4) 500 km

137. The maximum distance upto which TV transmission from a TV tower of height h can be received is proportional to:

(1) $h^{1/2}$ (2) $h$
(3) $h^{3/2}$ (4) $h^2$

138. In short wave communication waves of which of the following frequencies will be reflected back by the ionospheric layer having electron density $10^{11}$ per m$^{-3}$?

(1) 2 MHz (2) 10 MHz
(3) 12 MHz (4) 18 MHz

139. In the following common emitter configuration an npn transistor with current gain $\beta = 100$ is used. The output voltage of the amplifier will be:
(1) 10 mV  (2) 0.1 V

140. Using mass (M) length (L), time (T), and current (I) as fundamental quantities, the dimension of permeability is:

(1) $M^{-1} LT^{-2} A$  (2) $ML^2 T^{-2} A^{-1}$  
(3) $MLT^{-2} A^{-2}$  (4) $MLT^{-1} A^{-1}$

**ASSERTION AND REASONING**

§ In the following question (141-200), statement of assertion (1) is followed by a statement of reason (R)

If both Assertion & Reason are true and the reason is the correct explanation of the assertion then mark 1.
If both Assertion & Reason are true but the reason is not the correct explanation of the assertion, then mark 2.
If Assertion is true statement but reason is false, then mark 3.
If both Assertion & Reason are false statements, then mark 4.

**Assertion**

141. Mast cells in the human body release excessive amounts of inflammatory chemicals which cause allergic reactions.

142. Use of fertilizers greatly enhances crop productivity.

143. Smaller the organism higher is the rate of metabolism per gram weight.

144. Bats and whales are classified as mammals.

145. Severe Acute Respiratory Syndrome (SARS) originated in China.

146. Organochlorine pesticides are organic compounds that have been chlorinated.

147. Holoblastic cleavage with almost equalized blastomeres is characteristic of placental animals.

148. Inhabitants close to very busy airports are likely to experience health hazards.

149. All birds, except the ones like koel (cuckoo) build nests for retiring and taking rest during night time (day time for nocturnal).

150. Old age in not an illness. It is a continuation of life with decreasing capacity for adaptation.

**Reason**

141. Allergens in the environment on reaching human body stimulate mast cells in certain individuals.

142. Irrigation is very important in increasing crop productivity.

143. The heart rate of a six month old baby is much higher than that of an old person.

144. Bats and whales have four-chambered heart.

145. China is the most populated country of the world.

146. Fenitrothion is one of the organochlorine pesticides.

147. Eggs of most mammals, including humans, are of centrolecithal type.

148. Sound level of jet aeroplanes usually exceeds 160 dB.

149. Koel lays eggs in the nests of tailor bird.

150. Cessation of mitosis is a normal genetically programmed event.
151. A cell membrane shows fluid behaviour

152. In plant tissue culture, somatic embryos can be induced from any plant cell.

154. Water and mineral uptake by root hairs from the soil occurs through the apoplast until it reaches the endodermis.

155. Long distance flow of photo assimilates in plants occurs through sieve tubes.

156. Many visitors to the hills suffer from skin and respiratory allergy problems.

157. Yeasts such as *Saccharomyces cerevisiae* are used in the baking industry.

158. In a food chain, members of successive higher levels are fewer in number.

159. Tropical rain forests are disappearing fast from developing countries such as India.

160. Leaf butterfly and stick insect show mimicry to dodge their enemies.

161. Solution of $\text{Na}_2\text{CrO}_4$ in water is intensely coloured.

162. $\text{NF}_3$ is a weaker ligand than $\text{N} (\text{CH}_3)_3$.

163. PbI$_4$ is a stable compound.

164. $\frac{22}{11}$ Na emits a positron giving $\frac{22}{12}$ Mg.

165. Barium is not required for normal biological function in human.

166. Haemoglobin is an oxygen carrier.

167. Glycosides are hydrolyzed in acidic conditions.

168. Benzyl bromide when kept in acetone water it produces benzyl alcohol.

169. Activity of an enzyme is pH-dependent.
170. Alkyl benzene is not prepared by Friedel – Crafts alkylation of benzene

171. Hydroxyketones are not directly used in Grignard reaction

172. Trans-2-butene on reaction with Br₂ gives meso-2, 3-dibromobutane

173. Cis-1, 3-dihydroxy cyclohexane exists in boat conformation.

174. The increase in internal energy (ΔE) for the vaporisation of one mole of water at 1 atm and 373 K is zero

175. BaCO₃ is more soluble in HNO₃ than in plain water

176. ΔH and ΔE are almost the same for the reaction, N₂(g) + O₂(g) ↔ 2 NO(g)

177. Photo chemical smog is produced by nitrogen oxides

178. Increasing pressure on pure water decreases its freezing point.

179. The micelle formed by sodium stearate in water has –COO⁻ groups at the surface.

180. The O –O bond length in H₂O₂ is shorter than that of O₂F₂.

181. Temperatures near the sea coast are moderate.

182. The earth is slowing down and as a result the moon is coming nearer to it.

183. A tube light emits white light

184. Radioactive nuclei emit β⁻ particles

185. The resistivity of a semiconductor increase with temperature

186. The Coulomb force is the dominating force in the universe

187. The length of the day is slowly increasing

Alkyl halides are less reactive than acyl halides

Grignard reagents react with hydroxyl group

The reaction involves syn-addition of bromine.

In the chair form, there will not be hydrogen bonding between the two hydroxyl groups.

For all isothermal processes ΔE = 0.

Carbonate is a weak base and reacts with the H⁺ from the strong acid, causing the barium salt to dissociate.

All reactants and products are gases.

Vehicular pollution is a major source of nitrogen oxides.

Density of water is maximum at 273 K.

Surface tension of water is reduced by the addition of stearate.

H₂O₂ is an ionic compound.

Water has a high thermal conductivity.

The angular momentum of the earth moon system is not conserved.

Emission of light in a tube takes place at a very high temperature.

Electrons exist inside the nucleus.

The atoms of a semiconductor vibrate with larger amplitude at higher temperatures thereby increasing its resistivity.

The Coulomb force is weaker than the gravitational force.

The dominant effect causing a slowdown in the rotation of the earth is the gravitational pull of other planets in the solar system.
188. Bohr had to postulate that the electrons in stationary orbits around the nucleus to not radiate.

189. The possibility of an electric bulb fusing is higher at the time of switching ON and OFF.

190. The stars twinkle while the planets do not.

191. A beam of charged particles is employed in the treatment of cancer.

192. When a beetle moves along the sand within a few tens of centimeters of a sand scorpion, the scorpion immediately turns towards the beetle and dashed towards it.

193. When a bottle of cold carbonated drink is opened, a slight fog forms around the opening.

194. The size of a hydrogen balloon increase as it rises in air.

195. Owls can move freely during night.

196. It is hotter over the top of a fire than at the same distance on the sides.

197. The amplitude of an oscillating pendulum decreases gradually with time.

198. Microwave communication is preferred over optical communication.

199. Neutrons penetrate matter more readily as compared to protons.

200. In high latitudes one sees colourful curtains of light hanging down from high altitudes.
ANSWERS
1.(2) 2.(3) 3.(1) 4.(3) 5.(2) 6.(3) 7.(2) 8.(1) 9.(1) 10.(1) 11.(3) 12.(2) 13.(1) 14.(2) 15.(1) 16.(2) 17.(4) 18.(2) 19.(1) 20.(2) 21.(2) 22.(2) 23.(4) 24.(4) 25.(2) 26.(1) 27.(2) 28.(2) 29.(3) 30.(2) 31.(4) 32.(3) 33.(2) 35.(1) 36.(1) 37.(1, 2) 38.(1) 39.(1) 40.(2) 41.(1) 42.(1) 43.(4) 44.(1) 45.(3) 46.(2) 47.(2) 48.(4) 49.(2) 50.(1) 51.(3) 52.(4) 53.(2) 54.(3) 55.(2) 56.(4) 57.(4) 58.(3) 59.(3) 60.(4) 61.(1) 62.(2) 63.(4) 64.(3) 65.(2) 66.(3) 67.(1) 68.(4) 69.(2) 70.(4) 71.(1) 72.(1) 73.(1) 74.(2) 75.(3) 76.(1) 77.(2) 78.(4) 79.(2) 80.(4) 81.(2) 82.(3) 83.(4) 84.(3) 85.(4) 86.(3) 87.(2) 88.(2) 89.(1) 90.(4) 91.(3) 92.(3) 93.(4) 94.(3) 95.(3) 96.(2) 97.(2) 98.(2) 99.(4) 100.(3) 101.(2) 102.(1) 103.(4) 104.(4) 105.(3) 106.(1) 107.(1) 108.(2) 109.(3) 110.(4) 111.(3) 112.(1) 113.(3) 114.(3) 115.(2) 116.(3) 117.(2) 118.(2) 119.(1) 120.(1) 121.(2) 122.(3) 123.(3) 124.(4) 125.(4) 126.(1) 127.(2) 128.(2) 129.(3) 130.(2) 131.(4) 132.(3) 133.(2) 134.(3) 135.(3) 136.(1) 137.(1) 138.(1) 139.(3) 140.(3) 141.(1) 142.(2) 143.(3) 144.(2) 145.(2) 146.(3) 147.(3) 148.(2) 149.(3) 150.(3) 151.(1) 152.(1) 153.(3) 154.(2) 155.(1) 156.(2) 157.(1) 158.(4) 159.(3) 160.(1) 161.(1) 162.(1) 163.(?) 164.(?) 165.(2) 166.(3) 167.(4) 168.(1) 169.(2) 170.(2) 171.(1) 172.(3) 173.(4) 174.(1) 175.(1) 176.(2) 177.(2) 178.(3) 179.(2) 180.(4) 181.(1) 182.(4) 183.(1) 184.(3) 185.(2) 186.(3) 187.(9) 188.(1) 189.(1) 190.(2) 191.(1) 192.(1) 193.(2) 194.(3) 195.(1) 196.(1) 197.(4) 198.(4) 199.(2) 200.(2)
21. The crystal of lead zirconate is a key component of electrocardiography. It is a piezoelectric material (the material which has a net dipole moment and which can produce electricity when subjected to pressure or stress), ceramic or crystal in nature. Thickness of this material is the critical factor which allow proper vibrational frequency.

22. During fasting the sugar is digested from the reserve of thus sugar level goes down.

23. DNA fingerprinting is technically called DNA profiling or DNA typing or genetic fingerprinting. A technique invented by Sir Alec Jeffry of U.K. (1985) is used to identify a person on the basis of DNA specificity.

24. Increased contraction of ventricular muscles during systole first causes the closure of atrioventricular, bicuspid and tricuspid valve producing low pitch 'LUBB' sound. At the end of ventricular systole, semilunar valves shut producing second short and sharp sound, the 'DUPP'.

25. Plants are first trophic level, herbivores (or dairy breeds) are second and Mr X is in third trophic level.

26. Word health day - April 7
   No tabacco day - May 31
   World environment day - June 5

27. By measuring the level of oxygen pollution in water is measured. When larger amount of sewage is dumped into water, the BOD will increase.

28. Sesamoid bones are formed by ossification of tendon at joints

29. The empty follicle during oogeneses develops into corpus luteum. The cytoplasm of the corpus luteum is rich in a yellow pigment called lutein and hence known as yellow spot. Macula lutea is the yellowish spot present at the posterior pole of eye. Lutein, zeaxanthin, alpha-carotene and beta-cryptoxanthin are responsible of its yellow colouration.

30. During photorespiration O2 is taken by RuBP carboxylase and thus inhibits CO2 fixation during C3 pathway. The phosphoglycolate is converted into glycolate.

31. One is a vector and other is pathogen. Leishmania donovani is pathogen causing kala-azar and sand fly is a vector of this pathogen. Similarly Rat flea or Xenopsylla is a vector whereas Yersinai pest is a pathogen causing plague.

32. Because these are saturated fat rich substance which accumulate in the arteries and cause hypercholesterolemia

33. Highest amount of DDT can be detected in Indians due to its prolonged use.

34. Vasopressin regulates the amount of urine and thus it low secretion will lead to passage of much urine. Vasopressin has not effect on glucose metabolism.

35. tRNA has four recognition sites among these one is the amino acid attachment site with 3' terminal-CCA sequence.

36. Competitive inhibition is the process by which 2 substrates compete the active site on enzyme and the alternate substrate inhibits the reaction.

37. Mutualism - Both organism benefit - commensalism - one organism gains other is unharmed

38. Photo chemical smog was reported in Los Angeles. These oxidizing type of pollution is characterised by the presence of large concentration of ozone, oxides of nitrogen and various hydrocarbons.

Nitric oxide (NO) is formed by reaction between oxygen and nitrogen.
NO reacts with air forming NO2.
NO2 absorbs light and nitric oxide and nascent oxygen [O] are formed.
Nascent oxygen combines with molecular oxygen to form ozone.
Ozone reacts with unburnt hydrocarbons to give aldehydes and ketone.
Nitrogen oxides, oxygen and ketone gives rise to PAN.

39. Major pollutants like SO2, NO2 and particulate matter in which the SPM (suspended par-
ticulate matter) in Delhi's air exceed the permitted levels.

40. Increased stimulation of vagus leads to increase peristalsis resulting in excess secretion of HCl and pepsin in stomach. This leads to erosion of mucus and muscularis mucosa into the submucosa which leads to peptic ulcer.

41. Restriction enzymes or restriction endonucleases cleave DNA to specific sites when nucleotides of the two strands form inverted base sequence and are symmetrical around a given point. They are originally extracted from bacterium E.coli.

42. Wild ass is confined to Runn of Kutch (Gujrat). It is an endangered species.

43. Proposed by Watson and Crick. Also known as semi-conservative replication because each new double helix retains one strand of original DNA. Both new strands are synthesized in 5'-3' direction. Thus one strand is synthesized forward and other backward.

44. UGA and UAG are non-sense codons and UGG codes for tryptophan.

45. Concave lens is used for correcting myopia or shortsightedness. In myopia the eye ball is elongated and image is formed in front of retina.

46. Early embryos of different vertebrates resembles in possessing similar structures like notochord, tail, gill slits etc.

47. During ovulatory phase production of FSH decreases, while that of LH increases which leads to ovulation of about 14th day. Luteal phase lasts from 15-28 days Menstrual phase lasts for 3-5 days.

48. Somatostatin is secreted by delta cells of islets of langerhans, hypothalamus and some cells of digestive tract. They are stored and released from posterior pituitary gland.

49. *Spirulina platensis* contain 40 to 50% crude protein and its protein has balance composition containing all essential amino acids. During illness the proteins serve as nutrition and are thus disintegrated therefore protein rich diet is recommended.

50. Viroids are discovered by T.O Dineea (1971). They consists of a single stranded linear or circular DNA molecule and are not enclosed by protein coat. Its replication requires host’s encoded RNA polymerase.

52. Ferricyanide acts as electron receptor which is required for Hill reaction. Other requirement is illumination.

53. Mycorrhiza is an example of mutualism. The higher plants provide the fungi with carbohydrates and in return the fungi helps the plant in absorption of water, dissolution and absorption of inorganic nutrients locked in organic matter (especially nitrogen and phosphorus) which plant cannot absorb from soil.

54. Exine the outer layer of pollen grain is a acetolys resistant layer. It is made up of highly resistance fatty substance called sporopollenin. Sporopollenin is a protein which is imperious and this maintains the water in the body.

55. Red-green colour blindness is a recessive sex linked trait. The normal gene and its recessive allele are carried by X-chromosome. In male a single recessive gene (X\(<\)Y) will cause the disease whereas in female both the sex chromosomes carrying recessive gene (X\(<\)X\(<\)) will be affected.

56. Morula is a solid mass of 32 cells formed from zygote after successive mitotic division (after third division of cleavage).

57. Plasmodesmata are found in between the cells and act as channels by which the substance passes.

58. Quiescent centre is zone of no activity and this region has low concentration of DNA, RNA and protein.

59. Leaves of *Azolla* (a pteridophyte) are associated with blue green algae (*Anabaena azolae*) having capacity to fix atmospheric nitrogen and make it available to *Azolla*.

60. Seed is diploid (2n) generation, is capable to produce new plant and also contains diploid (2n) embryo. The seed is attached with (2n) mother plant, hence attached with parent generation to itself and capable to produce F2 generation for future.

61. (1) When a substance is placed in a magnetic field it causes greater concentration of the
lines of magnetic force within itself than in the surrounding magnetic field, it is said to exhibit paramagnetism. It is associated with the presence of unpaired electrons in an ion or molecule. K\textsubscript{2}O is paramagnetic molecule because it contains unpaired electron i.e., \((K^+\text{O}_2\text{O})\)

62. (2) The multidentate ligand, EDTA forms complexes of high stability with various metal ions. This is used in the estimation of hardness of water by a simple titration method. We know that hardness of water is caused by the presence of Ca\textsuperscript{2+} and Mg\textsuperscript{2+} ions. The difference in stability constant values, for example, the K value for Ca\textsuperscript{2+} and Mg\textsuperscript{2+} in EDTA complexes are \(10^{10.7}\) and \(10^{8.70}\) respectively which permits the selective estimation of different ions.

63. (4) In the case of oxyacids of phosphorus like H\textsubscript{3}PO\textsubscript{2}, H\textsubscript{3}PO\textsubscript{3} and H\textsubscript{3}PO\textsubscript{4} the central atom has sp\textsuperscript{3} hybridisation and therefore, surrounded by neighbouring atom tetrahedrally. Phosphorus occupy the central position and oxygen or –OH group occupies edges of tetrahedron in all cases.

64. (3). Copper in Cu(NH\textsubscript{3})\textsubscript{4}\textsuperscript{2+} is dsp\textsuperscript{2} hybridized and due to this reason it has square planar structure.

65. (2). An anticancer agent destroys the cancer cells. There are so many anti cancer agent are present but most common is cisplatin. Its chemical formula is Cis - [Pt Cl\textsubscript{2} (NH\textsubscript{3})\textsubscript{2}]. It is a complex compound of Pt.

66. (3). Among [V(H\textsubscript{2}O)\textsubscript{6}] SO\textsubscript{4}. H\textsubscript{2}O, Na\textsubscript{3}VO\textsubscript{4}, VOSO\textsubscript{4} and VCl\textsubscript{3} only Na\textsubscript{3}VO\textsubscript{4} is colourless species rest are coloured.

67. (1). In aqueous medium MnO\textsubscript{4}\textsuperscript{2-} reacts as
\[
3 \text{MnO}_4^{2-} + 2\text{H}_2\text{O} \rightarrow \text{MnO}_2 + 2\text{MnO}_2 + 4\text{OH}^- \\
\text{If we take only one molecule of MnO}_4^{2-} \\
\text{then, MnO}_4^{2-} + \frac{2}{3} \text{H}_2\text{O} \\
\rightarrow \frac{1}{3} \text{MnO}_2 + \frac{2}{3} \text{MnO}_4 + \frac{4}{3}\text{OH}^-
\]

68. (4). The oxidation state + (III) is most common in lanthanides, but some lanthanides contains two or three oxidation states. For example, Eu have + (II) and + (III) oxidation state which is very common.

69. (2). The mixture of conc. HCl and HNO\textsubscript{3} in 3 : 1 ratio is commonly known as aqua regia. It is so called because it can dissolve all the noble metals. In this mixture of aqua regia it contains NOCl.
\[
3\text{HCl} + \text{HNO}_3 \rightarrow 2\text{H}_2\text{O} + \text{NOCl} + 2\text{Cl}
\]

70. (4) Sodium metal dissolves in liquid NH\textsubscript{3} which gives blue solution. Which contain Na\textsuperscript{+} ion in solution as solvated state and solvated electrons. It can conduct electricity.

71. (1). Ligands such as CO, CN\textsuperscript{-} and NO\textsuperscript{+} have empty \(\pi\) orbitals with the correct symmetry to overlap with metal \(t_2g\) orbitals, forming \(\pi\) orbitals. This is often described as back bonding. These ligands are known as \(\pi\)-acceptors or \(\pi\)-acids.

72. (1) For the gravimetric estimation of copper (II), the compound thiocyanide is used and that compounds Cu\textsubscript{2} (SCN)\textsubscript{2}.

73. (1) The ore of copper is copper pyrite (CuFeS\textsubscript{2}) from which copper metal is mainly extracted. The reaction involves oxidation of Cu\textsubscript{2} S and then reduction of Cu\textsubscript{2} O to copper metal.
\[
\text{Cu}_2\text{O} + \text{FeS} \rightarrow \text{FeO} + \text{Cu}_2\text{S} \\
\text{3SO}_2 \\
2 \text{Cu}_2\text{S} \rightarrow 2 \text{Cu}_2\text{O} + 2\text{SO}_2 \\
2 \text{Cu}_2\text{O} + \text{Cu}_2\text{S} \rightarrow 6 \text{Cu} + \text{SO}_2
\]

Contact us: info@emedicalprep.com | +91-120-4616500
74.(2) The strongest acid among all given acid is benzoic acid, $C_6H_5COOH$. It is due to the fact that

$$\text{COOH}$$

is resonance stabilised, or in other words, $C_6H_5$ - group is electron withdrawing in nature which withdraws the electron from -COOH group H atom moves from this as $H^+$ ion and gives its electron to ring system along with carboxylate ion. In the case of $CH_3- COO\cdot CH_3$ group is electron pumping in nature which increases the electron density over -COOH group and removal of $H^+$ ion becomes difficult. Again in

$$\text{COOH}$$

$\text{OCH}_3$ group is electron pumping in nature which again increases electron density over -COOH group hence, acid strength decreases.

75.(3). All the given compound contains one electron withdrawing group.

$C_6H_5 - CH_2 NH CH_3$

contains one electron withdrawing group ($C_6H_5$) but it has two electron pumping group also. That is why this amine will behave as strongest base. $-NO_2$ group is electron with drawing group in $O_2 N - CH_2 - NH_2$ and it does not have electron pumping group. It is primary amine also that is why it will behave as weakest base.

76. (1).

The IUPAC name is 3-methyl cyclohexene-1-enol or 3-methyl cyclohexene.

77. (2) Hydrogen bonding is strongest when the bonded structure is stabilized by resonance. The compound of aromatic ring possesses resonance, like in phenol. That is why hydrogen bonding in phenol is strongest

78.(4). The group $-COOH$, $-CN$, $-COCH_3$ are meta directing. $-NHCOCH_3$ group is ortho / para directing group.

79.(2). $C_6H_6$ reacts in the presence of $H_2 SO_4$ with isobutene as follows

$$\text{CH}_3$$

$$\text{CH}_3 - C = CH_2 + H_2 SO_4$$

isobutene

$$\text{CH}_3$$

$$\text{CH}_3 - C - CH_3 + HSO_4$$

The tertiary carbonium ion (carbocation) reacts with benzene ($C_6H_6$) and given tert-buty1 benzene

80. (4) The most reactive nucleophile among the given compounds is $(CH_3)_3CO^-$ because 3° alkyl group is strongest electron pumping group. It will pump electron cloud over $CO^-$ and it will behave as strongest nucleophile.

81. (2). According to R-S configuration priority rule position 2 is anticlock wise and position 3 is also anticlockwise. Therefore the absolute configuration of the compound is 2s, 3s.

82. (3) One molecule of haemoglobin has four haem groups. Each haem group can co-ordinate with one oxygen molecule ($O_2$). So one haemoglobin can hold four oxygen molecule and becomes oxyhaemoglobin as

$$\text{Hb} + 4 O_2 \rightarrow \text{Hb} (O_2)_4$$

haemoglobin

oxyhaemoglobin
83. (4) At higher temperature $\text{CH}_3\text{CO}_2\text{C}_6\text{H}_5$ will give iodoform reaction. It is due to the fact that $\text{CH}_3-\text{C}-\text{group}$ gives this test. $\text{C}_6\text{H}_5-\text{O}$ will behave as $\text{C}_6\text{H}_5=\text{O}$.

It will release $-\text{C}\text{CH}_3$ group easily from $\text{C}_6\text{H}_5-\text{C}-\text{O}$.

\[
\begin{align*}
\text{C}_6\text{H}_5-\text{C}-\text{O} & \quad \text{CH}_3-\text{C}-\text{O} - \text{C}_6\text{H}_5
\end{align*}
\]

84. (3) 2-Hydroxymethyl serine is an a chiral aminoacid. For chirality all the group attached to carbon atom should be different. But in this case of 2-hydroxymethyl serine, the second carbon atom contain two $-\text{CH}_2-\text{OH}$ group. Hence, achiral. For example

\[
\begin{align*}
\text{OH} & \quad \text{NH}_2 \quad \text{O} \\
\text{CH}_2-\text{C}-\text{C}-\text{OH} & \\
\text{CH}_2-\text{OH} & \\
(2\text{-hydroxy serine})
\end{align*}
\]

85. (4) Nitrobenzene with Zn dust and aqueous NH$_4$Cl gives 62–68% yield of N-phenyl hydroxylamine

\[
\begin{align*}
\text{NO}_2 & \quad \text{Zn dust} \quad \text{NH}_4\text{Cl(aq.)} \\
\rightarrow & \quad \text{NH}_2 \quad \text{O} \\
\text{N-phenyl hydroxyl amine}
\end{align*}
\]

86. (3)

\[
\begin{align*}
\text{CH}_3-\text{CH}==\text{CH}_2 + \text{H-BH}_2 & \quad \rightarrow \quad \text{CH}_3-\text{CH}==\text{CH}_2 \\
\text{CH}_3-\text{CH}==\text{CH}_2 & \quad \rightarrow \quad \text{(CH}_3\text{CH}_2\text{CH}_2\text{)}_2\text{BH} \\
\text{(CH}_3\text{CH}_2\text{CH}_2\text{)}_2\text{BH} & \quad \rightarrow \quad \text{(CH}_3\text{CH}_2\text{CH}_2\text{CH}_3\text{B} \\
\text{CH}_3\text{CH}_2\text{OH} & \quad \rightarrow \quad \text{3CH}_3\text{-CH}_2-\text{CH}_2-\text{OH} \\
\text{3H}_2\text{O}_2/\text{OH}^- & \quad \rightarrow \quad \text{Propene-1-ol} + \text{B(OH)}_3
\end{align*}
\]

87. (2) The dipole moment of larger halogen with same alkyl group is minimum and with smaller halogen it is maximum. Only exception is fluorine because its electron affinity is less than that of chlorine. So the order of decreasing strength of dipole moment is $\text{CH}_3\text{Cl} > \text{CH}_3\text{F} > \text{CH}_3\text{Br} > \text{CH}_3\text{I}$.

88. (2) In Na$_2$O compound the crystal structure contain CCP in which all tetrahedral site is occupied by Na$^+$ ion. Since there are two tetrahedral site per atom, and all the sites are occupied by Na$^+$ ions for each $\text{O}^2-$ion. This structure is known as antifluorite structure. Now, one Na$^+$ is surrounded by four $\text{O}^2-$ion, whereas each $\text{O}^2-$ions surrounded by 8 Na$^+$  ion. Hence, co-ordination number of Na$^+$ is 4.

89. Due to resonance and electron withdrawing effect of ring, methyl group pumps electron towards ring and hyperconjugation can be seen in toluene. For example

\[
\begin{align*}
\text{H} & \quad \text{H} \\
\text{H} & \quad \text{H} \\
\text{H} & \quad \text{H} \\
\text{H} & \quad \text{H} \\
\text{H} & \quad \text{H}
\end{align*}
\]

That is why the bond dissociation energy of C-H is lowest in toluene.

90. (4) $\Delta E = m \Delta T$

\[
\text{where, } m = 1 \text{ g, } \Delta T = 6.12\text{K heat capacity of system } (S) = 1.23 \text{ kJ/g/degree}
\]

Now, Heat of decomposition

\[
\text{NH}_4\text{NO}_3 = 7.5276 \times 80 \\
(\text{since mol.wt of NH}_4\text{NO}_3 = 80)
\]

\[
= 602.2 \text{ kJ/mol}
\]

91. (3) Colligative property is a democratic property meaning it depends upon concentration of solute particles. Depression in vapour pressure due to the presence of no volatile solute is also colligative property. Naphthalene is a non-volatile solid, hence its addition in benzene decreases its vapour pressure.
92. (3) In the fuel cell chemical energy is directly converted into electrical energy. Basically fuel cell is a galvanic cell, in which combination of hydrogen and oxygen takes place (combustion) and it produces water or the net reaction is the same as burning of hydrogen and oxygen to form water. The reaction takes place as

At anode

\[ 2 \left[ \text{H}_2 \text{(g)} + 2 \text{OH}^- \text{(aq)} \rightarrow 2\text{H}_2\text{O (l)} \ 2e^- \right] \]

At cathode

\[ \text{O}_2 \text{(g)} + 2 \text{H}_2 \text{O (l)} + 4e^- \rightarrow 4 \text{OH}^- \text{(aq)} \]

Overall

\[ 2\text{H}_2 \text{(g)} + \text{O}_2 \text{(g)} \rightarrow 2 \text{H}_2\text{O (l)} \]

93. (4) The salt solution of weak acid and free acid mixture or solution formed by mixing a weak base with its salt of strong acid are called buffer solution. But \( \text{HClO}_4 \) is strong acid with its salt \( \text{KClO}_4 \) it will not behave as buffer solution.

94. (3) Standard entropy change \( \Delta S^\circ \) is greater than zero in such cases where number of products are more than the number of reactants for example,

\[ \text{NaNO}_3 \text{(s)} \leftrightarrow \text{Na}^+ \text{(aq)} + \text{NO}_3^- \text{(aq)} \]

95. (3) The magnetic quantum number \( m \) deals with the orientation of electron in three-dimensional space. i.e., spatial orientation of the orbital.

96. (2) The molecule \( \text{CH}_3-\left(\text{CH}_2\right)_4-\text{CH}_2-\text{NH}_2 \) has both polar \(-\text{NH}_2\) and non-polar \(-\text{CH}_3\) end so it is a surfactant.

97. (2) Form Faraday law of electrolysis

\[ Q = It \]

\[ I = 9.65 \text{ A (given)} \]

For deposition of 1 millimole of Al,

\[ Q = \frac{96500}{1000} = 96.5 \text{ Coulomb} \]

So,

\[ t = \frac{Q}{I} = \frac{96.5}{9.65} = 10 \text{ sec} \]

98. (2) If the resulting solution is basic at equivalence point then the pH of solution will be greater than 8. It is only possible when weak acid is titrated with strong base. For example, \( \text{CH}_3\text{COOH} \) when titrated by \( \text{NaOH} \)

99. (4) Among the given list oxygen is not a green house gas.

100. (3) The magnetic quantl. number \( m \) deals with the orientation of electron in three-dimensional space. i.e., spatial orientation of the orbital.

101. (2) The K.E of the Projectile

\[ = \frac{1}{2} m v^2 \]

And PE Of the Projectile in the earth's gravitational field

\[ = \frac{G M_e m}{R_e} \]

where \( m \) = mass of the projectile

\( M_e \) = mass of the earth

\( V \) = Velocity of the projectile

For escape velocity

\[ = \frac{1}{2} m v^2 = \frac{G M_e m}{R_e} \]

\[ \Rightarrow v^2 = \frac{2 G M_e}{R_e} \times \frac{R_e}{R_e} \]

\[ = 2 \left( \frac{G M_e}{R_e^2} \right) \times R_e \]
Where \( g = \left( \frac{GM_e}{R_e} \right) \)

\[ \Rightarrow \quad v = \sqrt{2gr_e} \]

Here we see that the velocity of the particle does not depend on the mass of the projectile.

102. (1) The Bernoulli’s equation is based on the work-energy theorem of the streamline flow of an ideal fluid. Its statement is as “the total energy per unit volume of a flowing liquid is a constant”

The statement in equation form is as

\[ P + \rho gh + \frac{1}{2} \rho V^2 = \text{constant} \]

Where

- \( P \): Pressure on the fluid
- \( \rho \): Density of fluid
- \( V \): Velocity of fluid
- \( H \): Height of the liquid column

103. (4). Because it can be highly focused

Since in surgery we need some very sharply focused beam. So we use laser beam

104 (4) Since we know that

\[ R = \rho \frac{l}{A} \]

Where \( \rho \): resistivity of the wire

\( l \): length of the wire

\( A \): Cross section Area of the wire

\[ \Rightarrow \quad \rho = \frac{RA}{l} = \text{constant} \]

\[ \therefore \quad \frac{R_1A_1}{l_1} = \frac{R_2A_2}{l_2} \quad \text{(1)} \]

Since volume of the wire remained constant

\[ \therefore \quad A_1l_1 = A_2l_2 \]

And

\[ A_1 = \pi \left( \frac{d}{2} \right)^2 = \frac{\pi d^2}{4} \]

\[ A_2 = \pi \left( \frac{d}{4} \right)^2 = \frac{\pi d^2}{16} \]

\[ \therefore \quad \frac{\pi d^2}{4} \times l_1 = \frac{\pi d^2}{16} l_2 \]

Given that \( l_1 = L \)

\[ \therefore \quad \frac{\pi d^2}{4} L = \frac{\pi d^2}{16} l_2 \]

\[ \Rightarrow \quad l_2 = 4L \quad \text{(2)} \]

Now putting the values of \( l_1 \) and \( l_2 \) in (1)

\[ \frac{R_1 \times \frac{\pi d^2}{4}}{L} = \frac{R_2 \times \frac{\pi d^2}{16}}{4L} \]

\[ \Rightarrow \quad \frac{R_1}{4} = \frac{R_2}{16} \times \frac{1}{4} \]

\[ \Rightarrow \quad R_1 = \frac{R_2}{16} \]

And \( R_1 = 10 \Omega \)

\[ \therefore \quad R_2 = 16 \times R_1 \]

\[ = 16 \times 10 = 160 \Omega \]

105 (3) Since the energy of the charged particle is

\[ = \text{P.D.} \times \text{charge} \]

And P.D.

\[ = \frac{1}{4\pi \epsilon_0} \frac{Q}{r} \]

And energy

\[ = \frac{1}{4\pi \epsilon_0} \frac{Qq}{r} \]

\[ \Rightarrow \quad \text{The energy (here K.E.) is independent of mass of the charged particle} \]

106 (1) Since the dipole has its torque in an electric field is as

\[ \tau = q \times d \times E \]

And force experienced by the charged particle is

\[ F = q \cdot E \]

Where

- \( q \): charge of the particle
- \( E \): electric field
- \( d \): separation between the two charges

Here we see that torque and force both will the experienced by the particle

107. (1) For capacitor, impedance is

\[ Z_c = \frac{1}{\omega C} \]

And for D.C., we know that
\[ w = 0 \]
\[ Z_c = \frac{1}{0 \times c} = \infty \]

Hence capacitor blocks the D.C. current. Hence the current in the circuit becomes instantaneously zero.

108. (2) Gallium has 3 valence electrons
So it will form the p-type semiconductor

109 (3) Since \( N = N_0 e^{-\lambda t} \)
\[ N = \frac{1}{16} N_0 \]
\[ \Rightarrow \frac{1}{16} N_0 = N_0 e^{-\lambda t} \]
\[ \Rightarrow \frac{1}{16} = e^{-\lambda t} \]
\[ \Rightarrow \frac{-\ln 2}{T_{1/2}} = e^{\frac{-\ln 2}{T_{1/2}}} \]
taking \( \log_e \) on both sides
\[ \log_e 1 - \log_e 16 = \frac{-\log^2}{T_{1/2}} \times t \times \log_e^x \]
\[ \Rightarrow -2.77 = -0.693 \times 40 \]
\[ (\text{Because } t=40) \]
\[ \Rightarrow T_{1/2} = \frac{0.693 \times 40}{2.77} = 27.72 \]
\[ = 10 \text{ days} \]

110 Let the K.E of neutron
\[ = \frac{1}{2} m_n \times v^2 \]

Deuteron has one proton and one neutron. So this energy will be distributed among all the three particles as one coming neutron and two deuterons constituent particles. So the K.E of the coming neutron has now
\[ \frac{1}{2} m_n v^2 \times \frac{1}{3} \]
\[ = \frac{1}{6} m_n v^2 \]

Loss of K.E.
\[ = \frac{1}{2} m_n v^2 - \frac{1}{6} m_n v^2 \]

\[ = \frac{3 m_n v^2 - m_n v^2}{6} = \frac{1}{3} m v^2 \]

Here let \( m_n = m_r \)

\[ \therefore \text{Fraction loss of K.E. is,} \]
\[ = \frac{1}{3} \frac{m v^2}{2} \]
\[ = \frac{1}{3} \frac{m v^2 \times 2}{m v^2} = \frac{2}{3} \]

So the answer will be \( \frac{2}{3} \)

111. The motion of planetary motion is based on the Kepler's laws of planetary motion.
And the Kepler's laws of planetary motion is based on the conservation of angular momentum

112. (1) Since we know that surface energy due to the surface tension
\[ = \text{Surface tension } \times \text{surface area} \]
\[ E_1 = s_1 \times T \]
\[ E_2 = s_2 \times T \]
\[ \{ \text{Because of the surface tension of the same liquid in same} \} \]
\[ \therefore \]
\[ E_1 = \frac{s_1 \times T}{s_2 \times T} = \frac{s_1}{s_2} \]
\[ E_2 = \frac{1}{(2)^{1/3}} = 1.2^{1/3} \]

113. (3) From the Stefan's formula we know that the heat radiated = \( \sigma \times T^4 \)
\[ \Rightarrow \]
\[ u_1 = \sigma(T_1)^4 \]
\[ u_2 = \sigma(T_2)^4 \]
\[ T_1 = 227 + 273 = 500 \]
\[ T_2 = 273 + 727 = 1000 \]
\[ \therefore \]
\[ \frac{u_1}{u_2} = \frac{\sigma \times (500)^4}{\sigma \times (1000)^4} = \frac{1}{16} \]
But \[ u_1 = 20 \text{ cal} \text{ m}^{-2} \text{ s}^{-1} \]

Contact us: info@emedicalprep.com | +91-120-4616500
114. (3) The effective spring constant

\[ K = K + 2K + 3K \]

Since the time period of oscillation

\[ T = 2\pi \sqrt{\frac{M}{K}} \]

And

\[ T = \frac{1}{f} \]

Where \( f \) = frequency of oscillation

\[ \Rightarrow \frac{1}{f} = 2\pi \sqrt{\frac{M}{K}} \]

\[ \Rightarrow f = \frac{1}{2\pi} \sqrt{\frac{3K}{M}} \]

\[ \Rightarrow f = \frac{1}{2\pi} \sqrt{\frac{3K}{M}} \]

115. (2) Since \( X \times p_x = \) constant

From the de-Broglie hypothesis

\[ P = \frac{h}{\lambda} \]

\[ \Rightarrow X \times \frac{h}{\lambda} = \) constant \]

\[ \Rightarrow X = \frac{\text{constant}}{h} = \) constant

\[ \Rightarrow x = \lambda \times \text{constant} \]

\[ \Rightarrow x \propto \lambda \]

So for the maximum accuracy the value of \( \lambda \) should be longer.

116 (3) The shift is

\( (\mu - 1) \lambda \)

And the shift of maxima is \( n:\lambda \)

\[ \Rightarrow (\mu - 1) \times t = n:\lambda \]

Where

- \( \mu \) = refractive index of thin film
- \( t \) = thickness of thin film
- \( \lambda \) = wavelength of the light

Here

- \( \mu = 1.5 \)
- \( t = 2\mu \) \( m = 2 \times 10^{-6} \)
- \( \lambda = 500 \text{nm} = 500 \times 10^{-9} \) \( m \]

\[ \Rightarrow (1.5 - 1) \times 2 \times 10^{-6} \]

\[ = n \times 500 \times 10^{-9} \]

\[ \Rightarrow 0.5 \times 2 \times 10^{-6} = n \times 500 \times 10^{-9} \]

\[ n = \frac{0.5 \times 2 \times 10^{-6}}{500 \times 10^{-9}} \]

\[ = \frac{1}{500} \times 10^{-6} \]

\[ = \frac{1}{500} \times 10^{3} \]

\[ = \frac{1000}{500} = 2 \]

So the central maxima will shift upward by two fringes.

117(2)

Since \( \lambda = \frac{h}{p} \)

\[ \Rightarrow \lambda \propto \frac{1}{p} \]

So the de-Broglie wavelength changes according to the momentum and vice-versa.

118 (2) Since the X-ray is produced due to the transition of electrons from higher electronic orbit to the lower electronic orbit.

119 (1)

\[ \text{Net force along AD} = F \sin 60^\circ - F \sin 60^\circ = 0 \]

120 (1).

\[ C = 2\mu F = 2 \times 10^{-6} F \]

\[ f = 1 \text{KHz} = 1 \times 10^3 \text{Hz} \]

\[ I = 2mA = 2 \times 10^{-3} A \]

Impedance

\[ Z_c = \frac{1}{\omega C} = \frac{1}{2\pi f \times C} \]

\[ = \frac{1}{2\pi \times 10^3 \times 2 \times 10^{-6}} \]
Now \( V = I \times R \)
\[ = 2 \times 10^{-3} \times 79.57 \approx 0.16V \]

121. (2) Since we know that the magnetic induction of the centre of a circular conducting loop of radius \( r \) is
\[ B = \mu \frac{n_i}{2r} \]

In this case, \( n = 1 \), \( r = 5 \times 10^{-2}m \)
\[ \mu_0 = 4\pi \times 10^{-7} \]
\[ B = 0.5 \times 10^{-5} \text{Wb/m}^2 \]
\[ i = \frac{B \times 2r}{\mu \times n} \]
\[ = \frac{0.5 \times 10^{-5} \times 2 \times 5 \times 10^{-2}}{4\pi \times 10^{-7} \times 1} \]
\[ = 0.39 \approx 0.4A \]

122. (3) Due to the ferromagnetic material
Actually the dipoles are getting polarised. So it gets some net dipole moment. And due to the net dipole moment the magnetic field induces. And this causes the deflection in the electric field

123. (3) From the Weins displacement law we know that \( \lambda_{max} T = constant \).
So the plot between \( I \) and \( \lambda \) should be symmetrical. But due to the catastrophe of the black radiation, if temperature increases wavelength having maximum intensity shifts towards left.

124. (4) From Gausses law
\[ \phi = \int E \cdot ds \]
Here \( ds = +q -q = 0 \)
\[ \therefore \phi = 0 \]

125. (4) Since we know that
\[ \frac{1}{v} + \frac{1}{u} = \frac{1}{t} \]
So as \( v \) increases \( u \) decreases continuously

126. (1) It happens only between the two light nuclii. Actually in heavy nuclii, the nucleus can not come close and contact.

127. (2) From Loretz force law we know that
\[ F = e \left( \vec{v} \times \vec{B} \right) \]
\[ \vec{v} = \hat{i} v_x \times \vec{B} = By \hat{i} \]
\[ F = e \left( v_x \hat{i} \times By \hat{j} \right) \]
\[ = e v_x B_y (\hat{k}) \]
So the place is in x-Z plane
And we know that in the magnetic field, the charge particles makes circular motion.

128 (2) 4 min.

129 (3) \[ v_2 = u^2 + 2as \]
\[ = 0 + 2 \text{ as} = 2as \]
\[ \Rightarrow v = \sqrt{s} \]
\[ \Rightarrow v \text{ is increasing as } s \text{ is increasing} \]

130 (2) The loop is attracted towards the \( i_2 \) Actually the direction of current \( i \), which is near to the wire \( i_2 \) in parallel. And parallel current attracts.
Again the current \( i_1 \) is also flowing in opposite direction to \( i_2 \) but it is far away from \( i_2 \). So this force is less in comparison to that force.
So that the loop is attracted towards the \( i_2 \)

131. (4) In going upwards the velocity decreases because \( v = u - gt \)
Again in coming downward, the vel increases because \( V = u + gt \)
so the curve should like (3) But due to the air resistance it not the sharp

132. (3) The radio active nuclei that are injected into a patient collects a certain sites with in its body and after radioactive decay it emits e.m. radiations. The e.m. radiations are detected by the detector. The process of diagnostic is called radiotracer techniques

133. (2) P.E.T.
It is called Pair Emission Technique when the electron and positron combine together to liberate energy as a r-ray, then that form of diagnostic process is called Pair Emission Technique

134. (3) Since \( R = 1.22 \frac{\lambda \times D}{a} \)
Where

- \( R \) = resolution
- \( \lambda \) = wavelength
- \( D \) = attitude of astronaut
- \( a \) = Pupil diameter
- \( \lambda = 500\text{nm} = 500 \times 10^{-9}\text{m} \)
- \( a = 5\text{mm} = 5 \times 10^{-3}\text{m} \)
- \( D = 400\text{Km} = 400 \times 10^{3}\text{m} \)

\[
1.22 \times \frac{500 \times 10^{-9} \times 400 \times 10^{3}}{5 \times 10^{-3}} = 48.8\text{m} \approx 50\text{m}
\]

135 (3) Since, the time difference

\[
= 4 \text{ min} = 4 \times 60 = 240 \text{ sec}
\]

\[
= \frac{4.5 \times t}{t-240}
\]

\[
= \frac{4.5 \times 240}{8} = 8(240)
\]

\[
\Rightarrow -3.5t = -8 \times 240
\]

\[
\Rightarrow t = \frac{8 \times 240}{3.5} = 548 \text{ sec}
\]

Since the min vel in 4.5 km/s.

So the minimum distance it will cover in

\[
4.5 \times t = 4.5 \times 548\text{km}
\]

\[
= 2466\text{km} \approx 2500\text{km}
\]

136. (1) Glycerine is a liquid

so when the lead goes inside than it has some velocity. After some time it acquires the terminal velocity and becomes constant

137. (1) Let the height of TV antenna = \( X \)

and

radius of earth = \( R_E \)

\[\text{A} = \text{top point of tower}\]

\[\text{B} = \text{the point of receiving station}\]

Now

\[Ac^2 = AB^2 + Bc^2\]

\[(R_E + h)^2 = AB^2 + R_E^2\]

\[\Rightarrow R_E^2 + h^2 + 2R_E \cdot h = AB^2 + R_E^2\]

\[\Rightarrow AB^2 = h^2 + 2R_E \cdot h\]

Since \( h^2 << R_E \)

\[\Rightarrow AB^2 = 2R_E \cdot h\]

\[\Rightarrow AB = \sqrt{2R_E \cdot h}\]

138. (1) Since reflected frequency

\[= 9 \times \frac{1}{2}\]

Where \( n = \text{electron density} = 10^{11} \)

\[= 9 \times (10^{11})^{1/2}\]

\[= 9 \times (10^{10} \times 10)^{1/2}\]

\[= 9 \times \sqrt{10} \times 10^5\]

\[= 3.16 \times 10^5\]

\[= 28 \times 10^5\]

\[= 2.8 \times 10^6 = 2.8\text{ MHz}\]

139 (3) Output voltage

\[= B \times \text{Input Voltage}\]

\[= 100 \times 10^{-2} = 1\text{V}\]

140 (3)

\[\Rightarrow F = \frac{\mu}{\pi} \times \frac{m_1 m_2}{l^2}\]

\[\Rightarrow \mu = \frac{F \cdot l^2}{m_1 m_2}\]

Where \( m_2 \) and \( m_2 \) are the magnetic strength.

\[\Rightarrow \mu = \frac{MLT^{-2} \times L^{-2}}{(AL) \times (AL)} = MLT^{-2}A^{-2}\]

141. Allergic reaction develop in response to histamine released by mast cells. This allergic reaction is triggered by cross linking of IgE molecule on the surface of mast cells by an allergen. These histamines released by mast cells initiate inflammatory response which trigger the arrival of leukocyte at the site of allergen or infection.
142. Indian soils are found deficient in nutrients like nitrogen, phosphorus and potash. Maximum yield can be achieved by using fertilizer rich in these nutrients.

Water is an essential component of vital activities in plant.

So both fertilizer and irrigation are important for high yield.

143. BMR or Basic Metabolic Rate is inversely related to weight and volume of an organism i.e. small the organism higher is BMR.

Heart rate of a six month old baby is 110 to 112 beats/min. Whereas old aged person may have max. heart rate of 160 beats/min.

144. Four chambered heart is also present in some reptiles. Bats and whales though have 4 chambered heart but also posses other mammalian characters like milk gland, pinnae, hairs on the body, presence of diaphragm etc.

145. SARS was first reported (WHO) in China. The high population in China is not directly responsible for the origin of SARS.

The killer pneumonia virus (a type of corona virus) is responsible for SARS origin.

146. Organochlorides are organic compounds that have been chlorinated and have very low biodegradation and gets accumulated in environment. e.g. DDT, BHC etc.

Fenitrothion is organophosphate pesticide which are organic ester of phosphoric acid and its derivative. Though they are toxic but are biodegradable.

147. In eggs of Amphioxus and eutherian mammals including rabbit and man holoblastic cleavage takes place. The holoblastic cleavage produces blastomeres of equal size.

Centrolecithal eggs are found in insects and in some hydrozoa. Meroblastic cleavage occurs in them.

148. Noise level upto 60 dB (decibel) is well tolerated. Whereas jet sounds upto 150-160 dB. But jet aeroplanes normally donot land in common airports without an emergency.

149. Koel and cuckoo need not build nest because they use nest of other birds and incubate their eggs and nuture hatchlings of these birds (Crows). In this way they are nest parasites. Tailor bird is a garden bird which makes its nest by sewing and has no relations (direct) with koel or cuckoo.

150. As a result of ageing or senescence there is a progressive deterioration in structure and function of body tissue and organs. Immune system is no more effective and chances of illness increases. Cessation by mitosis is not a genetically programmed event.

151. Fluid mosaic model was given by S. J. Singer and G. L. Nicolson (1970). Proteins float in a bilipid layer according to bilipid membrane model.

152. Embryoids or somatic embryo has the ability to form full fledged plant. (Cellular totipotency)

153. Anthcyanin pigment are present in cell sap of vacuole. These are colouring pigment of certain higher plants that impart reddish and greenish colour. It is no a photosynthetic pigment.

154. Apoplastic movement: Pertaining to the movement of water in free space of tissue; free space includes cell walls and intercellular space. Through root hair to endodermis water moves through apoplasts. But in the case of endoderms which has suberised and partially cutinised wall obstructing the passage of water to xylem vessels. From here water moves by symplasm.

156. Some trees like oak, elm, mountain cedar etc. produces allergic pollen grains which may cause sneezing, itching in eyes and nose etc.

Conifers produce large quantity of wind born pollen grains because many pollen grains are destroyed in the process of pollination by wind.

157. Fermentation is used in baking therefore yeasts the agent of fermentation are used in baking industries.

158. Number of organisms at any trophic level depends upon the availability of food. In grassland ecosystem the maximum number of organism are found in lower trophic level but in forest ecosystem and parasitic food chain it is reverse.

159. Tropical rain forests are very rich in bio diversity.
160. By adopting mimicry butterflies blend with the surroundings and protect themselves from enemies.

161. (1) Due to the oxidation state of chromium (+6) in Na₂CrO₄ it is intensely coloured.

162. (3) NF₃ is weak ligand than

\[
\text{CH}_3 - \tilde{\text{N}} - \text{CH}_3
\]

because fluorine is strong electronegative element which withdraws the electron cloud of nitrogen atom and hence, its tendency to coordinate its lone pair of electron decrease, whereas \((\text{CH}_3)_3\tilde{\text{N}}\) is strong ligand because it has three electron pumping group i.e., \(-\text{CH}_3\) group, which increases the electron cloud over nitrogen and makes this molecule strong ligand as it can easily coordinate its lone pair of electrons.

163. PbI₄ is not a stable compound because Pb shows (II) oxidation state more frequently only some times due to inert pair effect. It shows + (IV) oxidation state. Secondly iodine cannot stabilize higher oxidation state.

164. Due to one β particle emission this change happens:

\[
\text{^{11}Na}^{2+} \rightarrow \text{^{12}Mg}^{2+}
\]

Again proton emission convert proton in to neutron:

\[
\text{p} \rightarrow \text{n}^+ + 1 \beta^0
\]

165. (2) Barium is not required for normal biological functions is true statement, again, barium shows only +2 oxidation state not variable oxidation state is also true.

But this explanation for the no requirement of barium in normal biological function is not true.

166. (3) The haemoglobin is oxygen carrier as in oxyhaemoglobin \text{Hb} (O₂)₄ is true but O₂ does not binds as \text{O₂} with Fe. Most appropriately we can say oxygen binds as \text{O₂} to Fe of heme part.

167. (4) Glycosides can be prepared by treating glucose with \text{CH}_3 - \text{OH} in the presence of dry HCl gas. They can not be hydrolysed in acidic medium. They are hemiacetals and not acetals.

168. (1) Benzyl bromide when kept in acetone water it produces benzyl alcohol is true.

\[
\begin{array}{c}
\text{CH}_2\text{Br} \\
\text{Hydrolysis} \\
\text{H}^+ + \text{H}_2\text{O}
\end{array} \rightarrow \begin{array}{c}
\text{CH}_2\text{OH} \\
+ \text{HBr}
\end{array}
\]

169. (2) Activity of enzyme is pH dependent, it is true. The change in pH affects the solubility of the enzyme in water is also true but this is not the correct explanation of activity of enzyme based on pH.

170. (2) It is true that alkyl benzene can not be prepared by Friedel crafts alkylation of benzene. It is due to the fact that monoalkyl product formed undergo alkylation to form polyalkylated benzene. Reason is true that alkyl halide is less reactive than acyl halides but this is no the explanation of assertion.

171. (1) Both the assertion and reason are true and explain each other because Grignard reagents reacts with hydroxyl group of hydroxyketone that is why hydroxy ketone are not used directly in Grignard reagent.

172. (3) It is true that trans- 2- butene on reaction with \text{Br}_2 gives meso -2, 3- dibromobutane. But this reaction does not involves syn-addition of bromine.

173. (4) cis- 1, 3- dihydroxy cyclo hexane exist in chair form of conformation.
There is hydrogen bonding between the two hydroxyl group

174.(1) For all isothermal process internal energy, $\Delta E = 0$, it is true. That is why $\Delta E$ for vaporisation of one mole of water at 1 atm. and 373 K is zero

175.(1) $\text{BaCO}_3 + 2 \text{HNO}_3 \rightarrow \text{Ba(NO}_3)_2 + \text{CO}_2 + \text{H}_2\text{O}$
Because $\text{BaCO}_3$ is weak base and reacts with $\text{H}^+$ ion of nitric acid and due to this its salt $(\text{Ba(NO}_3)_2)$ dissociated in $\text{HNO}_3$. Where as water does not have such type of strong $\text{H}^+$ ions.

176.(2). For the reaction

$\text{N}_2(g) + \text{O}_2(g) \rightarrow 2\text{NO}_2(g)$

$\Delta H$ and $\Delta E$ are almost same, it is true. It is also true that all products and reactants are gases but its not correct explanation

177.(2). Photo chemical smog is produced by nitrogen oxide, it is true. But it is natural phenomenon, however, it has been accelerated by vehicular pollution but it is not correct explanation of photo chemical smog.

178.(3). Freezing point decreases at high pressure on pure water is true. But the density of water is maximum at 4°C i.e., 273 + 4 = 277 K

179.(2). Micelle formed by Na-Stearate in water has –COO$^-$ group at the surface is true. It is also true that surface tension of water is reduced by the addition of stearate but it is not correct explanation of micelle formation. Micelle is formed if molecules with polar and non polar end assemble in bulk to give non-polar interior and polar exterior

180.(4). In $\text{F}_2 \text{O}_2$ , O – O bond length is shorter as compare to O – O bond length of $\text{H}_2 \text{O}_2$. $\text{H}_2 \text{O}_2$ is non ionic compound. Both the assertion and reason in this question is wrong.

181.(1) Temperature near the sea coast is moderate. Because the water heats up and cools down very slowly. So the thermal conductivity generally does not take place.

182.(4) According to classical calculations, the earth is not slowing down. It moves with constant velocity. Again the angular momentum is also conserve, because $K = r \times p$
So both the statements are wrong.

183.(1) The tube emits white light due to the fluorescence, and this phenomenon takes place at very low pressure at 0.01 mm $\text{Hg}$. But not at high temperature

184.(3) The $\beta^-$ particles emitted by the radio nuclii. The $\beta^-$ emission takes place due to the conversion of neutron into proton. It does not take place due to the presence of electron inside the nucleus.

185.(2). The resistivity of the semiconductor decreases with increase of temp. the atoms of a semiconductor vibrate with larger amplitudes at higher temp. there by increasing its conductivity not resistivity.

186.(3) The gravitational force is more dominant in the nature. This the the cause of the stability of the planatary motion.

187 The earth is not slowing down due to conservation of angular momentum.

188. (1) These are the Bohrs postulates

189.(1) This happens due to the induction produced in the wire.

since $E = \frac{dL}{dt}$, so if $\frac{dI}{dt}$ changes, $E$ changes and it causes the fusing.

190.(2) This happens due to the variation of density of the different layers of the air. Again the intensity of light on our eye is very small in comparison to the planets. So this happens
But the size of star giving no affect at all.

191. (1) It is really used in the treatment

192. (1) Both the statement are true.

When a beetle distrubs the sand, it sends pulses of along the sand surface one set of pulses is fast longitudinal and the other will he slower transverse.

193. (2) This happens due to the fact that the pressure inside the bottle is large in comparison to the outside. So the adiabatic expansion tales place And due to the lowering of temperature the gas condenses and vapour forms.

194. (3) This happens due to the reduction of the pressure

Again the material of the balloon can we easily stretched

195. (1) Owls can move freely during night because it has a large no of rods on their retina

196. (1) Due to the thermal radiation light moves up. So the temperature at the upper part is more than the temperature at lower point.

197. (4) Since, \( f = \frac{1}{2\pi} \sqrt{\frac{g}{e}} \)

So the \( f \) does not depend on time and remaining constant

198. (4) As we know that the information carrying capacity is directly proportional to the band width. So that wider the band width greater the information carrying capacity.

199. (2) Neutron can penetrate easily in to the matter because it does not has the charge. So the Coulomb repulsion does not take place

Again its size is slightly large

200. (2) This happens due to the fact that the earth is a magnet. So the deflection of the charged particle at the polar region takes place.
